Licenciatura en sistemas de información

Alumno: Iván Matías Acevedo

Directora: Daniela López De Luise

Módulo de predicción con minería de datos aplicado al mercado de divisas

Introducción

Este módulo de minería de datos es un recomendador, que como usuarios, los traders podrian utilizar como una herramienta más de confirmación para realizar una compra o venta en el mercado de divisas.

Objetivos

Objetivo general:

 Realizar recomendaciones de compras o ventas a traders que operan en el mercado de divisas Forex, mediante diferentes modelos de predicción.

Objetivos específicos:

- A partir de datos históricos, seleccionar variables relevantes y compilar datos.
- Analizar datos y desarrollar dos modelos predictivos de adaptación a series temporales.
- Mediante weka utilizar los modelos de predicción desarrollados mostrando B (si el precio baja), I (si se mantiene) o S (si sube).

Propósito

Implementar una herramienta liviana y práctica, fácilmente parametrizable y con características de autoajuste para ponerla a disposición de la industria y el público como un servicio.

Mercados financieros

Los Mercados Financieros, es el lugar donde confluye la oferta y la demanda de Activos Financieros. Si de la confluencia de la oferta y demanda existe acuerdo en el precio, cantidad y fecha de liquidación, nace formalmente una operación financiera negociando el activo financiero.

Los activos financieros que se comercializan dependen del tipo de mercado al cual pertenecen.

Mercados financieros

Mercados de Activos Tradicionales:

- Mercados de depósitos interbancarios
- Mercados de Renta Fija
- Mercados de Renta Variable
- Mercados de Divisas

Mercados de Instrumentos Derivados:

- Mercados de Futuros
- Mercados de Opciones
- Mercados de Swaps

Mercado de divisas

Consiste en la compra-venta de divisas (monedas), esto es, dinero. Las divisas son comerciadas a través de un broker y son comerciadas en pares, por ejemplo euro y dólar estadounidense: (par EUR/USD). Otras divisas como: GBPUSD, USDJPY, EURCHF, entre otros.

USDARS

Ejemplo de una divisa o par exóticos.

Análisis Fundamental

Es un método que se emplea para evaluar el valor intrínseco de un activo y para analizar los factores que podrían influir en su precio en el futuro. Este tipo de análisis se basa en la evaluación de los activos a partir de hechos e influencias externos, así como de los estados financieros y de las tendencias industriales.

Análisis Técnico

El análisis técnico es un sistema que permite examinar y predecir los movimientos de precios en los mercados financieros a partir de datos históricos, estadísticas de mercado y patrones graficos.

Planteo del problema

El mercado de Forex está influenciado por múltiples acontecimientos mundiales que afectan a la oferta y la demanda del mismo. De esta manera pronosticar la suba o baja del precio no solo depende de ciertas variables como, un análisis sobre patrones **técnicos** a lo largo del tiempo, sino también de otros datos **fundamentales** como sucesos sociales, decisiones políticas de un país o un banco central, el PBI de un país, inflación, etc.

Estas múltiples variables son un problema para los traders a la hora de ingresar al mercado, no solo por la cantidad sino también por la complejidad de interpretación que tienen.

Solución

- Se buscará crear un servicio que sea un recomendador para los traders que son quienes operan en los mercados de financieros.
- Este servicio no será la única herramienta utilizada por los traders sino que será un apoyo más como confirmación, a la hora de tomar decisiones de compra o ventas.
- Será un módulo inteligente desarrollado mediante datos históricos donde se pueda saber si el precio va a bajar, quedar igual o subir dentro de los próximos 15 minutos.

Metodologías y herramientas

- Inteligencia Artificial
- Minería de datos para series temporales
- Metodos de prediccion:
 - Árbol de inducción: J48
 - Red neuronal: MultilayerPerceptron
 - Metacluster: Make Density Based Clustering
- Selector de atributos:
 - Ranker
- Weka
- Python

Antecedentes

Ventas de pasajes

El objetivo principal es reducir diferentes tipos de costos fundamentalmente los producidos por el combustible. Por tal motivo, poder pronosticar la demanda de pasajeros consiste en un trabajo fundamental. Este tipo de información permite tomar acertadamente decisiones tales como aumento y/o disminución de frecuencias, cambios de equipos, inversión en equipos nuevos, aumento y/o disminución de tarifas, entre otros.

Salud

Una de las prioridades de estudio es saber las futuras proyecciones del comportamiento de la mortalidad general intrahospitalaria para prever recursos humanos, de infraestructura, equipamiento tecnológicos y financieros y así reducir el incremento de muertes, motivo por el cual se tiene como objetivo determinar el mejor modelo de predicción mensual que se ajuste a la serie original para hacer predicciones a corto plazo.

Desarrollo de modelos de datos

Proceso de DataSet Inicial

- Se desarrolló dos algoritmos en python para generar dos dataset y así poder crear dos modelos diferentes:
 - Algoritmo 1: Agrupando de a 15 elementos.
 - Algoritmo 2: Restando el primer elemento.
- Utilizando precio de cierre.
- Vectores de 15 elementos.

Algoritmo 1: Agrupando de a 15 elementos

Consiste en:

- 15 columnas, más la columna de variación llamada Class (B-I-S).
- La primer fila son los primeros 15 elementos partiendo del primero.
- Se segunda fila partiendo del segundo elemento los 15 elementos.
- Luego partiendo desde el tercer elemento...
- Este dataset se le asigna el nombre de DataSet_1.csv

DataSet_1

Cargando datos en weka

Informacion del dataset en weka

- 92.253 Instancias.
- Para S encontró 37.775, para I 15.932 y para B 38.546.
- Detecta un máximo de 12.252 un mínimo de 11.663 y un precio medio de 11.879.
- Datos perdidos 0% (Missing).
- Datos distintos 551 (Distinct), datos únicos 27 (Unique).
- El Name que indica el nombre de la columna.

Vista gráfica de datos en weka

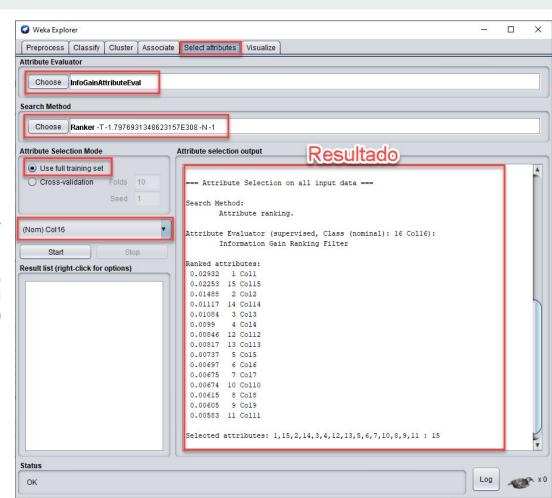

Herramienta de calificación de atributos

Análisis de atributos

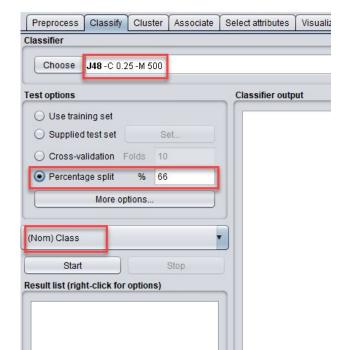

La herramienta Ranker retorna el ranking de columnas según cuánto podrían contribuir al momento de predecir. En el primer puesto queda la columna 1 llamada "Col1" y en el segundo puesto la columna 15 llamada "Col15".

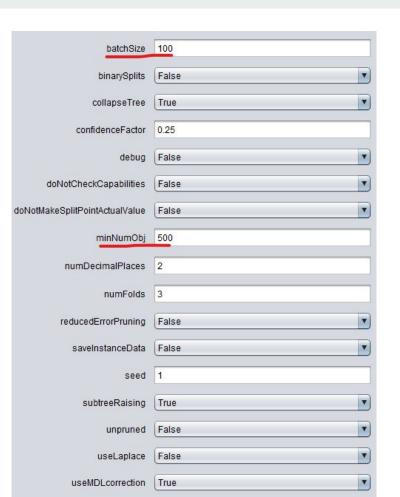

La columna 1 y 15 se están utilizando para calcular la columna Class, que es "S" o "I" o "B" dependiendo si el precio de la columna 15 baja, sube o queda igual con respecto al precio de la columna 1.

Creando modelo con Árbol de inducción y Red neuronal.

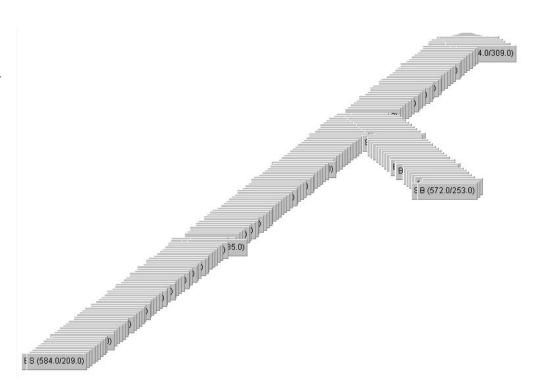

Árbol de induccion

Árbol de induccion

Resultado gráfico de procesar DataSet_1 con J48

Árbol de inducción

- Cuando fue "S", clasificó como S 11665 veces (aciertos)
- Cuando Fué "B", clasificó como "B" 11438 veces (aciertos).
- Cuando fue "I" se equivocó en todas.
- Clasifica un poco mejor las subas.

Obtener modelo

 Modelo que luego se cargará junto con los datos para realizar las predicciones.

Validación de modelo de red neuronal del DataSet_1.

Validación del modelo

- Primero se debe generar el modelo de la red neuronal (archivo .model).
- Es necesario obtener los datos que se utilizarán para realizar las pruebas (archivo arff).
- Los datos de prueba deben pasar por el mismo proceso de los datos que se utilizaron para crear el modelo.

Archivos de validación

- Es en formato arff.
- La última columna class debe ir con un "?".
- @relation: nombre que identifica al conjunto de datos.
- @attribute: Establece el nombre las columnas.
- @data: Indica la sección donde van los datos.

@relation DataSet 1 Test

Predicción del precio

- La columna inst, es el número de instancia del dataset.
- predicted: es lo que predijo, puede ser B, I o S.
- prediction: es la probabilidad de que haya sucedido (de 0 a 1).

inst	predicted	prediction
1	3:B	1
2	3:B	1
3	3:B	1
4	3:B	1
5	3:B	1
6	3:B	1
7	3:B	1
8	3:B	1
9	3:B	1
10	3:B	0.999
11	1:S	0.999
12	1:S	1
13	1:S	0.999
14	1:S	1
15	1:S	1
16	1:S	1
17	1:S	1
18	1:S	1
19	1:S	1

Generar modelo para el DataSet_2.

Algoritmo 2: Restando el primer elemento

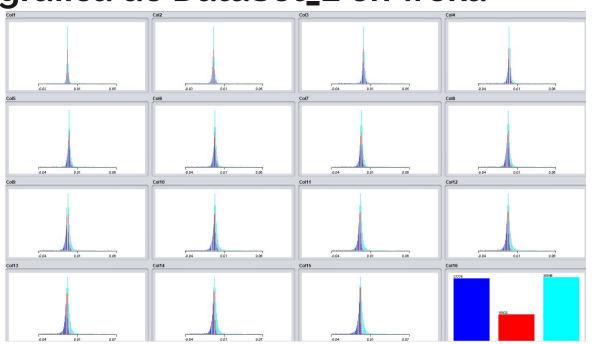

Consiste en:

- Agrupar vectores de a 16 elementos. ej. (10, 5, 45, 8, 6, 7, 12, 14, 32, 15, 11, 18, 10, 14, 15, 10) comenzando desde el primero, luego el segundo..
- A todos restarle el primero comenzando desde el segundo.
- resultado ejemplo: (5, -35, 2, 4, 3, -2, -4, -22, -5, -1, -8, 0, -4, -5, 0, B)
- Este dataset se le asigna el nombre de DataSet_2.csv

Vista gráfica de DataSet_2 en weka

Red Neuronal

- Las características de los datos no permitió que la red neuronal pueda aprender (kappa statistic siempre queda en 1).
- Datos demasiados simples (perfectos dentro de un rango), la red neuronal no puede desarrollar un modelo confiable que pueda predecir.
- Aprende de memoria.

validationThreshold 20

Proceso de normalización

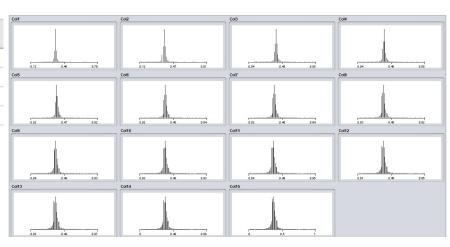

$$X_{normalized} = \frac{X - X_{min}}{X_{max} - X_{min}}$$

Consiste en:

- Proceso de normalización a DataSet_2.
- Para que funcionen mejor muchos algoritmos de Machine Learning usados en Data Science, hay que normalizar las variables de entrada al algoritmo.
- Comprimir o extender los valores de la variable para que estén en un rango definido (0-1).
- X es el dato que ingresa a la función comenzando desde el primer elemento del dataset hasta el último, Xmin es el menor de todos los números del dataset y Xmax es el mayor elemento de todo el dataset.

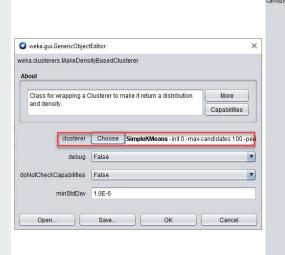

DataSet_3

Con el agrupador: Make Density Based Clusterer

- Para DataSet_3
- El mejor resultado que se obtuvo fue con 10 clusters.

Resultado: Make Density Based Clusterer

- EL "Log likelihood" es la medida para saber si el modelo es bueno.
- 44.9 es lo mejor que se logró.

Cluste	red Inst	aı	nces
0	8197	(26%)
1	3301	(11%)
2	2213	(7%)

Resultados de modelo MakeDensityBasedClusterer

Promedio general: 99.78 (Promedio general de aciertos)

Predicción de bajas: 99.65 (Promedio de aciertos de bajas)

Predicción de iguales: 99.965 (Promedio de aciertos de iguales)

Predicción de subas: 99.98 (Promedio de aciertos de subas)

Trabajos futuros:

- Desarrollo de API.
- Front-End

Demo final:

- Datos de los último de enero del 2022.
- El círculo indica los del 31/01.

Fin

iGracias!
